The commander stepped outside the stuffy command post tent and breathed in the night air as he tried to contain his growing frustration. His staff had just finished an update, painting a grim and incomplete picture of the brigade combat team’s (BCT) current state. The commander struggled to understand what had gone so wrong. The fight had started successfully with air insertions of deep observation posts, seizure of key terrain, and the successful prosecution of enemy targets with indirect fire, attack aviation, and fixed-wing aircraft. In short, the BCT had seized the initiative from the enemy.
That was over thirty-six hours ago. Since then, reporting had ceased, communications had collapsed, and units had repeatedly failed to attain their designated objectives. The cavalry squadron had not yet achieved its planned reconnaissance and security objectives, resulting in repeated surprise attacks and costly penetrations of the BCT’s zone. It had gained only two to three kilometers since its initial deployment. The field artillery battalion, which had started so well, had since fired only a few ineffective missions after the initial targets planned for the operation’s opening phase. Close air support (CAS) and attack aviation had ceased inflicting the devastating effects of the first day. Combined arms battalions had either stumbled into contact with significant losses for no appreciable gain or had been repeatedly surprised by the enemy in their attack positions. To make matters worse, the brigade support battalion commander had complained to him earlier in the day that every unit was clamoring for “emergency resupply” of all commodities. He had no idea how many casualties the BCT had taken in the recent contacts. Finally, the brigade engineer battalion operated in a constant state of crisis as insurgents and special purpose forces wreaked havoc across the BCT rear area with asymmetrical attacks and deadly accurate indirect fire that seemed to materialize out of nowhere and everywhere.

The BCT tactical operations center (TOC) was faring no better. Although everyone was working frenetically trying to resolve the friction that had ground the BCT to a halt, these efforts had resulted in no greater understanding of the BCT’s situation nor had they provided any realistic means to get it moving again. Some staff officers had started pointing to failures at the subordinate level, while others had exceeded their ability to process the multiple simultaneous issues that bombarded the BCT on an hourly basis. Few had slept more than a few fitful hours slumped over at their stations or in their vehicles. This included the BCT commander himself. The attempted “two-minute” update had taken forty-five minutes but made clear that staff running estimates remained wildly inaccurate and incomplete. To make matters worse, the BCT executive officer (XO) had just completed a scratchy and decidedly one-way telephone call with the division operations officer, who demanded that the BCT regain the offensive as soon as possible. The commander was supposed to receive a staff planning update for the operation to seize the provincial capital, but he thought it would merely waste time given the TOC’s current state. The commander was unsure how to restore order and resume offensive action akin to that of the first day. It was frustrating and bewildering. What to do?

Introduction

The situation described above happens nearly every month at the National Training Center (NTC). Most BCTs come to the NTC with a solid baseline of training and preparedness for the first day of the fight. They routinely attack the contested reception, staging, onward movement, and integration (RSOI) process with alacrity. Many BCT leaders think that their unit is ready to go on the offense as soon as the fourth day of RSOI. No matter how far geographically or fast physically the BCT gets on the first day, however, the initial mission invariably devolves into twenty-four to forty-eight hours of what can be described as a BCT-wide collapse of offensive action. The BCT’s subunits and staff make contact with the enemy and are hampered by the terrain, which in turn produces a deleterious effect on time available to continue planning. These inputs compound, producing a level of friction that most units have not experienced in training. Units and staffs enter survival mode, trying desperately to work through the pressing problems in front of them to the detriment of the larger mission. In this situation, reporting, sustainment, communication, and planning break down, leaving battalion and BCT staffs in the dark as to the state of units and their adherence to orders. Any enemy contact reverberates throughout the BCT, causing further confusion. The net result of friction at every level causes a collapse in tempo and offensive action, resulting in paralysis across command posts and attack positions. Why does this happen?

As a reasonable approximation of combat, the NTC induces a level of friction not re-created anywhere else. Home-station training cannot replicate the space, terrain, time, enemy, and stress that the NTC produces at the tactical level. The first forty-eight hours probably represent the first simultaneous deployment of every BCT element at doctrinal distances under combat conditions against an enemy capable of dominating all forms of contact. In this light, the general collapse of tempo and offensive action is understandable and part of the training process. The first few days also expose the BCT’s systems to friction in a way that no other training event short of combat can. In many ways, the most powerful drivers of friction are BCT- and battalion-level staff organization, processes, and procedures. Most staffs are not adequately organized according to plans, current operations (CUOPs), and mobile command group
sections. Even if they are, staff functions rarely remain clearly defined as the BCT makes contact, and everyone tries to understand the current problem to resolve the immediate threat. The BCT often outruns the plan; the staff does not continue planning, and consequently fails to prepare to transition the BCT from one operation to another. In this situation, battalions and companies stumble into unplanned contact with the enemy, unsupported by BCT-level enablers. These independent and desynchronized actions rarely result in BCT-wide offensive action and increased tempo.

Communications difficulties due to range, terrain, load, training deficiencies, and mistakes cause difficulties even understanding what is happening, much less directing actions of subordinate units. To resolve this, BCT commanders often resort to understanding and directing the BCT by talking directly to battalion commanders on tactical radios. Although this can prompt action, it often results in plans developed in isolation from staffs and lacking BCT-level enablers. These radio conversations can also generate additional friction as battalion commanders often “talk their way out of” directed tasks because they lack assets, need more time, or their situation (combat power, casualties, sustainment, and communication) prevents continued offensive action.

How to shorten this inevitable loss in tempo is a topic of much discussion at the NTC, and its answer is existential in nature given the enemies and situations we are likely to face throughout the world. The following discussion is meant to spark thought, but it is not a prescriptive guide to resolving the friction inherent in combat.

Know the Collapse Is Coming

One of the main causes of the collapse is physiological. Units, leaders, and soldiers spend RSOI in a heightened state of alert and activity that cuts into sleep and interrupts the normal rhythms of garrison. RSOI at the NTC is designed to help a unit “see itself” in a way not possible in garrison. While enormously beneficial, this process can stress a unit and its leaders as unforeseen problems emerge and must be dealt with quickly, often at the expense of planning, eating, and rest. The planning and preparation for combat, as well as the unit’s exposure to the NTC, Operations Group, and its observer, coach, trainers (OC/Ts), only add to task and time demands, causing further stress. RSOI also introduces the unit to NTC’s contested environment, wherein it faces insurgent attacks, rocket strikes, and drone swarms, to name only a few forms of contact with which leaders must contend while building combat power. Finally, nervousness, anxiety, adrenaline, and a desire to prove oneself are intermingled to the point that the first twelve to twenty-four hours of action are a release from RSOI and the logistics support area. These emotional and physical conditions closely replicate those of precombat, and if harnessed effectively, can be a positive impetus for aggressive action. The costs of this heightened state, however, often remain hidden until manifesting themselves across the force in the subsequent twenty-four to forty-eight hours after the first operation.

BCT-level planning for the first attack is regularly the most complete and detailed of the rotation despite some initial unfamiliarity with the environment. OC/T coaching is also the least impactful at this stage since OC/T suggestions are largely theoretical for the unit until after it makes contact. As a result, plans are frequently overly ambitious in their geographical objectives and rarely take the enemy, terrain, and time into full account. Units also invariably fail to consider the amount of friction that their own systems and processes will encounter after first contact. Units deploy, have some success, and gain some ground but inevitably encounter the enemy at a time or place in an unplanned manner. The friction and shock of this first surprise encounter rapidly ripples up from the lowest unit and across the BCT, causing confusion, and routinely, the end of offensive action.

Unit leaders look inward to solve their immediate problems, reporting breaks down, and the BCT ceases to act in concert as reacting to contact consumes its constituent parts. The hyperactivity of the preceding days rapidly turns into fatigue as the stress of initial contact combines with a lack of rest. Sustainment problems swiftly develop in these conditions due to deficiencies in reporting and planning. Additionally,
training, equipment, and maintenance deficiencies accumulate to cause BCT-wide failures in communications, control, and sustainment.

Countless historical descriptions of first contact, from the phalanx to conflicts today, point to the commonality of this situation in combat. The adrenaline of preparation, the frenetic activity prior to the mission, followed by the shock of first contact create an unprecedented level of what Carl von Clausewitz described as friction, or the fabled “fog of war” experienced by every commander in conflict and training throughout military history. The fog of war is often thought of as a lack of information that leads to inaction. However, it is also the multiplication of inputs to the BCT after contact leading to a state of confusion that often results in paralysis and inaction. The NTC can inflict a BCT with every form of contact, stressor, and inducer of friction simultaneously, which compounds the fog of war in the first days. In fact, this is part of its mandate: to replicate the stress of combat in a way that causes the BCT and its soldiers “to have their hardest day in the desert so that they do not go untrained into combat.”

While the fog and friction of the first days of combat cannot be completely eliminated, their time and effect can be reduced. Knowing they are coming and preparing the BCT’s leaders for the physical, mental, and emotional rigors of the first hours and days of the fight is the first step. Physical fitness that results in combat endurance is critical. Training the mind through historical examples in a leader professional development/self-development program will give leaders some context as they think about the trials likely facing them in the first fight. Tactical decision games that focus on actions after the breakdown of the plan and absence of further orders will train junior leaders to think through the fog of war. Leaders must develop and enforce rest plans throughout RSOI and especially during the first few days of contact, as the body and mind acclimate to the shock and rigors of combat, simulated or otherwise. Finally, leaders must share this understanding with their soldiers, from the most junior to senior levels, through discussion, and more importantly, training.

Lethality is a Necessary but Insufficient Condition for Success

It is a truism that lethal squads, crews, platoons, and companies form the building blocks of victory at NTC and in combat. Although this is undoubtedly the case, lethality at the small-unit level is necessary but not sufficient to fight through the fog of war. Too often, even the most lethal formations are surprised by the enemy, make contact at an unexpected place and time, and are forced to fight on the enemy’s terms to shore up the situation. Win, lose, or draw, these small-unit actions inescapably result in combat losses that slow the tempo of the company, the battalion, and the BCT, if not immediately followed by a combined arms fight that reinforces success. Observations at NTC also indicate that deficiencies in the science and art of terrain and enemy analysis, and the inability to execute actions on contact at the platoon level contribute to combat losses, even with favorable system-to-system kill ratios.

Platoons and companies rarely take the necessary steps to sufficiently secure themselves in the attack positions in a way that prevents the enemy from surprising them to tactical advantage. They infrequently conduct quartering parties; practice security at a halt; execute local patrolling or stand to/stand down; develop range cards, sector sketches, or platoon fire plans; or the myriad other activities that constitute security. The enemy inevitably exploits these opportunities and weaknesses. Consequently, a spoiling attack can surprise a unit in a key location, penetrate its position, and wreak havoc throughout the BCT. Platoons and companies do not report in enough detail, eventually leaving the BCT ignorant as to the enemy and friendly situation. Orders are then given without regard or knowledge of the true situation, causing further confusion and disorder. A lack of discipline in field maintenance and during logistic package resupply also causes BCT-wide effects, as units utilize limited assets for “emergency” resupply and maintenance. The wear and tear on sustainment units, systems, and soldiers ultimately contribute to a collapse of tempo.

Preventing the accumulation of small-unit deficiencies that result in BCT-wide problems requires the discipline born of repetitive training. Leaders at the BCT level should never have to order a platoon or company to report, secure, and sustain themselves. The current live-fire-centric model of unit training requires a great deal of crew, squad, and platoon gunnery proficiency. This has yielded positive results for units at NTC. Live fire alone, however, will not ingrain the skills of automatic reporting, security, and sustainment without ruthless enforcement during training. Leaders should
not assume that their small-unit leaders know how to perform these tasks to standard. They may need to start with a white board or a Micro-Armor (miniature model) explanation followed by a walk-through.

A review of standard operating procedures (SOPs) and reports may also prove necessary to ensure standardization across the BCT. Finally, training that requires small units to establish security, report, and sustain themselves for long durations under combat conditions—repeatedly—best builds the muscle memory required to perform these tasks in combat or at NTC. Each repetition should be executed and evaluated under increasingly more difficult conditions (day, night, chemical attack, degraded communication, drone observation, etc.) and for longer duration. Units must be evaluated on these tasks using training and evaluation outlines, be given an after action review, and be required to do it again. This kind of training can be done at a gunnery or at low cost in local training areas.  

**Mission Command Requires Discipline and Accountability**

Leaders routinely misunderstand the concept of mission command regarding planning and execution of operations at NTC. There is often a sense that orders, timing, requirements, reports, and battle-rhythm events are in some ways negotiable if they interfere with or do not conform to lower-unit actions or expectations. Missed suspenses and tardy reporting, unperformed requirements, and a lack of communication add to the general collapse as the BCT tries to understand why subordinate units have not accomplished their assigned missions. A reluctance persists to enforce these requirements either through direct or general admonishment. This disinclination to require compliance is frequently coupled with planning mistakenly deliberate in its lack of details, which the staff hopes will enable commanders to exercise initiative. These conceptual plans usually lack adequate graphic control measures, timing, tasks, and triggers, subsequently hindering the BCT’s ability to control the fight or
These two factors—a lack of adherence to the plan and conceptual planning—often lead to problems of land management, coordination, synchronization, sustainment, and combining arms, as each unit fights its own war according to its perceived needs. Doing so does not result in a BCT fight that restores offensive action. Instead, it often leads to defeat in detail and fratricide.

Controlling the BCT fight also necessitates detailed planning of actions, triggers, and timing. This staff work constitutes the science of combat and cannot be neglected if the BCT expects to combine arms effectively. NTC requires BCTs to conduct the meticulous work necessary to use indirect fire, attack aviation, CAS, special munitions, and other assets in the way they would have to in combat. Applying assets for a BCT fight requires detailed graphic control measures and synchronization of actions in time and space. Therefore, leaders must adhere to the plan if the conditions that the BCT sets remain in effect in order to accomplish their given tasks as part of the overall fight. If an internal condition prevents battalion adherence to the plan, it is a subordinate commander’s responsibility to report and have a discussion early enough for the BCT and the staff to mitigate risks and modify the plan.

Although control limits a leader’s scope of action in a theoretical sense, it actually provides the framework for exercise of initiative because it tells a commander what to do where and when, not how to do it. Ample room remains for a commander to exercise initiative and creativity in task organization, sequence, application of internal assets, etc. Good graphic control measures and the applied science of control also lend clarity to the situation, delineate boundaries, and allow for the effective use of combined arms. Control does not negate the art of command. The commander’s intent is also a powerful guide for action, especially when the plan breaks down due to the friction inherent in any fight. The key tasks in the intent statement not only have to be accomplished but also have to be done in time and space to be effective. Units will have to fight through the enemy and friction to
accomplish these tasks that set the conditions for victory. None of these considerations preclude a commander or subordinate leader from assessing the situation, applying the commander’s intent, and then acting to exploit an opportunity that not only achieves the intent but also places the unit in a position of advantage vis-à-vis the enemy. For example, a battalion or company tasked to establish an SBF position could surprise the enemy and continue to maneuver around or behind a position to achieve a more decisive effect than a straightforward SBF. Doing so achieves the required result while also exploiting an opportunity inherent in mission-type orders. Conversely, the commander and staff retain responsibility to communicate intent clearly and to design straightforward, yet flexible plans, which allow for command, control, the exercise of initiative, and the assumption of risk.

The concepts of command, control, discipline, and accountability as they relate to mission command need to be explained and trained at home station in order to prevent misunderstanding and confusion for leaders throughout the formation. Taking the time to discuss the requirements of decisive action as they relate to mission command through conversation and reading can go a long way to building a shared approach to command and control prior to the rotation. Additionally, trainers should design scenarios that require leaders to exercise initiative and assume risk to meet their stated objectives in time and space according to the plan and the commander’s intent. This can be done through tactical decision games, training exercises without troops, and simulations.

Training leaders to think and adapt is the commander’s responsibility and will achieve the shared understanding and mutual trust required of mission command. Discipline and accountability, however, must be ruthlessly enforced in garrison, training, at NTC, and in combat. Leaders should attempt to find ways to match battle-rhythm events and reporting formats and requirements in garrison to those that they will use in combat. There can be no excuses for late or inaccurate reports. A climate of accountability will help to dissipate the fog of war quickly and allow the BCT to act in concert to achieve its mission.

**Shared Understanding Is a Battle Drill**

Units and leaders struggle to achieve shared understanding after the BCT makes and sustains contact. The friction of the fight and breakdown of reporting result in a dearth of critical information required for the commander to visualize the fight. In this state, commanders attempt to visualize based on the limited information they have, but they are typically forced to rely on their experience, intuition, and sense of the problem.

That critical commander’s visualization can be hindered by a fog of war that prevents units, staffs, and command posts from getting the information that allows the commander to understand the situation before visualizing and prescribing a proper course of action.¹⁸ As emphasized above, reporting and enforcement of the battle rhythm, SOPs, and procedures help generate understanding. Staffs are the primary agents for taking this information and generating the common operating picture (COP) that helps everyone in the BCT understand the situation. The COP is often thought of as a thing, as in “what is the COP?”¹⁹ That question really concerns how the COP is transmitted and received, whether through digital or analog means. These are the media or means of transmission that make the COP common. The inputs, overlays, reports, and updates make the COP an operating picture. To be useful, the COP, therefore, has to be complete (accounting for all applicable warfighting functions [WfFs], overlays, and control measures); it has to be duplicated using analog, digital, or combined techniques; it has to be distributed; it has to be updated with timely and accurate inputs; and it has to be used by subordinate units.²⁰

Staff running estimates (SREs) that accurately reflect the current state of the BCT across WfFs form the basis for building a COP that allows for shared understanding. Too often, SREs remain inaccurate because the reporting required to maintain them is either erroneous or absent. Consequently, the staff’s attempt to update the commander or inform plans is ineffective at best and leads to poor decisions at worst. To be effective, SREs must be standardized across WfFs and in subordinate units. The format, content, display, and ability to be communicated needs to be the same in the battalion and the BCT TOCs.

Doing so enables staffs to communicate quickly and efficiently. It also lends clarity to not only what needs to be reported when but also how it needs to be reported. It is best to have both a digital and analog version of the SRE to allow for continued use without power or during jumps. Although each WfF section will have different data they have to collect to inform the COP,
SREs can and should be standardized to allow for clarity and brevity when conveying information. Each WfF must have a set of tools: maps, graphics, references, products, and procedures to help with the analysis inherent in a good SRE process. A standardized SRE can also be used as the single format for staff updates, “two-minute drills,” commander’s or battle update briefs, and shift changes. They can be used face-to-face, over the radio, or via digital means.

Each WfF should have its own PACE that allows for reporting, collaboration, and coordination with subordinate and higher units. Liaison officers (LNOs) to the BCT should have their own SREs that inform current operations and plans. An internal WfF PACE and LNOs who can inform the BCT keep unneeded traffic off the command net, speed reporting, and reduce friction by giving WfF leads the means to reach up and across the formation for needed information. This is why communicating over the tactical internet is so important in a decisive action fight. Without it, WfFs rely on push-to-talk (radio) and type-to-send (lower tactical internet) systems and channels that are time-consuming and typically reserved for commanders.

With digital connectivity, WfFs and LNOs can use chat, SharePoint graphic sharing, and most importantly, phones to coordinate. It also connects the systems that allow for the application of combined arms and allows BCT-level WfFs to pull information from and coordinate the use of assets with division.

Focusing on accurate SREs standardized across the BCT and WfFs, can help rapidly rebuild situational understanding after first contact. Doing so also allows staff officers to move from making educated guesses to providing analysis and recommendations that allow the commander and subordinate units to visualize the fight and direct the actions necessary to restore offensive action.

Like the other aspects of the BCT fight, standard SREs and the tools that accompany them have to be developed and used at home station to be effective at NTC. Staffs, especially WfF CUOPs representatives, must be trained and practiced on their use and analysis before combat. Introducing new processes to untrained personnel during RSOI or the rotation rarely works. The staff, like platoons and companies, must have multiple repetitions under progressively more rigorous conditions to be successful in generating shared understanding during the fight.

### Planning While Fighting

One of the greatest drivers of friction after first contact is the BCT’s staff struggle, and often failure, to continue to plan and prepare for the next mission while fighting the current one. It is common to see multiple staff primaries, the XO, operations officer (S3), and commander around a map desperately trying to understand the situation and forge a way forward after the first twenty-four hours. These sessions, while typically long in time, are short on answers and solutions. The chaos, collapse, and fog of war often continue despite the staff’s willingness to forgo almost every other activity while trying to find a way to restore order and action.

In the absence of order, BCT commanders will often try to impose it by establishing radio communication with battalion commanders and directing BCT actions through these discussions. In either case, the BCT falls prey to a cycle of reaction followed by enemy counteraction, which requires another reaction. Planning for the division-directed BCT mission and transitions regularly breaks down or becomes neglected as the BCT, battalions, and companies stumble into and out of fights that inflict additional losses and further slow tempo. A lack of reporting, action, and inaccurate data from incomplete SREs leave planners, who are often precommand maneuver captains, without the means to effectively plan.

Staff primaries habitually find themselves consumed with immediate problems to the detriment of their vital contribution to planning. The result can be a plan developed in a vacuum, not quality controlled by field-grade officers, issued too late, and without the detail necessary to fight the BCT fight. As a result, rehearsals usually degenerate into war games as commanders and staff primaries struggle to rectify an incomplete and conceptual plan with the realities on the ground.

Preventing the situation described above requires the structure and discipline to continue to plan for directed operations while fighting the current fight. Primary staff officers must first understand the difference between the military decision-making process (MDMP) and the rapid decision-making and synchronization process (RDSP).

MDMP primarily orients the BCT on the division-directed missions that must be executed in time, space, and effect in coordination with other BCTs and division actions. It also produces a plan that allows...
the BCT to transition from one phase to another to maintain momentum. It constitutes a quasi-scientific process that gives the commander the staff’s best estimate of the situation and the means to resolve tactical problems. Doing so requires the expertise resident at the field-grade level. Majors, primary staff officers, and noncommissioned officers have the responsibility to apply the science necessary to transform concepts into a detailed plan that can be rehearsed and executed. Therefore, staff primaries must be present and an integral part of MDMP throughout. The BCT XO enforces this requirement.

Additionally, BCTs cannot commit planners to developing solutions for the immediate fight if the BCT expects to continue to plan. Accurate SREs enable the planners to base the steps, processes, and products on the realities on the ground versus ones that are not feasible because they fail to take the true situation into account. BCT commanders must also be disciplined enough to take only those officers who are absolutely necessary with him in the mobile command group to allow for continuous planning. This may mean leaving not only the intelligence and fire support officers but also the S3 at the TOC to allow for effective input into and supervision of the MDMP.

If the MDMP constitutes the means for action, the RDSP fulfills the requirement for reaction to enemy activity.\textsuperscript{22} The chief of operations (CHOPs) and those personnel that man the CUOPs floor must be empowered to understand, coordinate, and act to resolve the current situation or threat without disrupting the planning or preparation for the next fight. Doing so requires timely and accurate reporting, SREs that feed the COP, and the means to direct action based on an established PACE plan by WfFs. It also requires staff leads to train, inform, and empower their representatives on the CUOPs floor.

Ideally, enemy actions or contingencies should be dealt with without involving the BCT commander, the XO, or primary staff officers. In reality, the commander and XO may have to withhold some authorities at their levels to ensure that assets are applied according to the rule of law and the overall intent. These caveats should be few to allow for BCT-wide freedom of action.

To be effective, staff articulation, field-grade officer participation, and CUOPs responsibility for RDSP must be practiced and enforced in garrison and during training events. Iterative command-post exercises that place BCT staffs in a situation where they must plan division-directed tasks while resolving immediate threats will build the systems, processes, and skills necessary to maintain doing so at the NTC and in combat. Articulating the authorities necessary to fight the BCT fight and training the CHOPs and his or her staff to execute RDSP immediate action without relying on the commander, S3, and XO will help the BCT remain focused on planning while dealing with contingencies and the friction of first contact.

\textbf{BCT Enablers Have to Be Planned to Be Used and Not Everyone Can Get Them}

A modern U.S. Army BCT deploys to the NTC or combat with a set of enablers and capabilities that allows it to fight a combined arms battle across a wide frontage against a similarly capable enemy. The transformation of brigades into BCTs in the twenty-first century has given commanders the ability and staff the responsibility to coordinate and apply assets that previously resided at the division level. Frustratingly, BCTs typically struggle to apply this vast and powerful array of combat capabilities to sustained effect after first contact. All of the various factors described above contribute to this often maddening fact. The main cause of the failure to apply assets effectively lies in how they are routinely used after the BCT outruns the plan. CAS, attack aviation, intelligence collection one of the greatest drivers of friction after first contact is the brigade combat team’s staff struggle, and often failure, to continue to plan and prepare for the next mission while fighting the current one.
platforms, and electronic warfare assets are the weapons of first resort in an attempt to resolve the friction and the fog of war. In the absence of an effective reconnaissance or security fight, BCTs will consistently commit their unmanned aerial sensor platforms without effective suppression of enemy air defense or priority intelligence requirements that focus collection and determine the enemy’s course of action.

CAS and attack aviation are often committed in the same way in the hope that doing so will cause enough attrition to allow for the restoration of offensive action. Battalions will often demand that the BCT “enable” their attempts to attack or restart their reconnaissance with the same set of assets controlled at the battalion level. These disjointed commitments of valuable assets are usually more than mildly dissatisfying as they not only fail to achieve their intended effect but also routinely result in the costly loss of critical systems and capabilities for the division-directed fight.

The hard truth is that these awesome capabilities can only be utilized efficiently if the BCT staff does the detailed planning necessary to employ them in time and space for a BCT-level effect. Piecemealing or task-organizing assets might result in local successes, but these are fleeting because the advantage they garner lasts minutes to hours at the most if these efforts are not followed by offensive ground maneuver. Additionally, the unplanned application of BCT-level enablers inevitably results in a restricted fires environment as these platforms violate gun target lines and make air and ground difficult to manage. This often results in lost systems, and tragically, fratricide. Finally, the unplanned commitment of BCT assets usually means that they are absent when the BCT must execute its division-directed missions.

Detailed planning remains the best means for the BCT to shape the deep fight, enable the close fight, and combine arms at the decisive point. Using the techniques described above will help staffs understand the situation and provide the means to continue to plan while fighting. The key is an unwavering focus on the decisive point where the BCT must shape for, and enable, the main effort of the decisive operation to accomplish the BCT’s mission. All other considerations are secondary. This means that battalion commanders must understand they may want fires, attack aviation, CAS, and other enablers but should not count on them if they are not the main effort.

This is a difficult pill to swallow, especially for leaders habituated to the counterinsurgency fight when these assets were readily available and could be applied by battalions, companies, and platoons with devastating results because of overmatch. This simply cannot happen in a decisive action fight where the targets outnumber the systems available to engage them, and the enemy can find, target, and destroy these assets with relative ease. Husbanding these resources, planning for their application, and delivering the might of a U.S. BCT at the decisive point must be the staff’s goal.

The conversation that informs leaders from platoon to BCT levels of the realities of the enabler fight in decisive action has to begin at home station. Doing so establishes expectations and trains the staff to stay focused on the decisive point. It also lets small-unit leaders know they will have to rely on their own assets—scouts, Raven unmanned aerial vehicles, mortars, and maneuver forces—to resolve their tactical problems if they are not the main effort. Too often, battalions ask for BCT assets when they have not fully committed their own.

Staffs must practice the development and management of the unit airspace plan, manage crew availability, and deconflict fire support coordination measures with attack aviation and CAS at training events. Intelligence officers, fire support officers, and supporting staffs must be able to develop high-value target lists, attack guidance, priority intelligence requirements, and attrition criteria to effectively fight the BCT fight. Leader professional development programs, command-post exercises, and reduced-force fire coordination exercises that require detailed planning are excellent means to achieve a level of proficiency and understanding before deploying to NTC or combat.

**Will and Action Resolve Friction and Create Opportunities**

Finally, and most critically, the commander must exercise iron will to lead his or her formation through the collapse. Doing so necessitates making decisions in the face of uncertainty and having the moral courage to see them through. Delaying a decision in the hope of perfect situational understanding only exacerbates the state of collapse. It may also require some uncomfortably direct, but necessary, conversations between the commander, the staff, and subordinate commanders. It might necessitate specific or general admonishment when these leaders
and units fail to adhere to the standards of reporting, compliance, planning, and action required to fight through friction. It could require the commander to order battalions to continue to attack or resume offensive action despite losses and a lack of enablers. A BCT commander may need to move to a unit that has repeatedly failed to meet its objectives to ensure that it succeeds. None of these potentially unpleasant conversations need be personal, but they will be necessary and better than inertia and defeat.

In any case, restoring offensive action will be born of will, driven by intellect, and informed by tough repetitive training. As Hans von Seeckt aptly stated,

> The essential thing is action. Action has three stages: the decision born of thought, the order or preparation for execution, and the execution itself. All three stages are governed by the will. The will is rooted in character, and for the man of action character is of more critical importance than intellect. Intellect without will is worthless, will without intellect is dangerous.\(^{23}\)

This is why commanders are placed in charge of units and given the awesome and burdensome responsibility to lead them. It is one only a commander can shoulder. But our soldiers and victory depend on it.

> After several minutes of contemplation, a deep calm came over the BCT commander as he realized that the situation that he and the BCT faced was the very one they had trained to fight through. With renewed vigor, he strode back into the TOC and told his expectant staff, “We are trained for this. XO, get the guidons ready for a battle update in an hour. S3, assemble the Wff leads and the planners; I want to get an update and issue guidance before we start. We are about to start taking the fight to the enemy.” ■

**Author’s note:** The author would like to thank the leaders and soldiers of the brigade combat teams who trained at the National Training Center from August to June 2018–2019 for their dedication, professionalism, and desire to learn valuable lessons in the desert. He would also like to thank the professionals of the National Training Center, the Operations Group, and, especially, the brigade trainers (Bronco Group) for their comments, corrections, expertise, and commitment to training. The descriptions, lessons, and suggestions contained in this article do not reflect a particular unit and are the observations of the author alone. They do not represent official trends nor are their prescriptions those of the National Training Center or Operations Group.

**Notes**

1. *Merriam-Webster’s Collegiate Dictionary*, 11th ed. (2003), s.v. “collapse.” The term collapse is used throughout this article to describe the unexpected and widespread results of the friction the brigade combat team (BCT) experiences after first contact. According to *Merriam-Webster*, to collapse is “to suddenly lose force, significance, and effectiveness,” which best describes what happens to a BCT. The use of the term is not meant to imply that this takes place because of neglect or poor planning but to suggest that the consequences of friction are so sudden and its scope so unexpected that responding to it effectively is extremely difficult.

2. *Army Techniques Publication (ATP) 3-90.1, Armor and Mechanized Infantry Company Team* (Washington, DC: U.S. Government Publishing Office [GPO], January 2016), 2-13. The eight forms of contact are direct; indirect; nonhostile; obstacles; chemical, biological, radiological, nuclear; aerial; visual; and electronic warfare.

3. Communications difficulties typically include issues with retransmission system positioning and functioning, establishment of Army Battle Command Systems using upper tactical internet, and the consistent ability to communicate using Blue Force Tracker or the Joint Capabilities Release systems. Many other issues are the result of incomplete precombat checks and inspections, a lack of critical equipment or not-mission-capable systems that are unreported, or a lack of proper training and supervision. The accumulation of these soldier-level tasks lead to BCT-wide friction.

For fictional accounts of mechanized combat, see Harold Coyle, Team Yankee: A Novel of World War III (Philadelphia: Casemate, 2016); Ralph Peter, Red Army: A Novel of Tomorrow’s War (New York: Pocket Books, 1989).

6. Carl von Clausewitz, “Friction in War,” in On War, ed. and trans. Michael Howard and Peter Paret (New York: Oxford University Press, 2007), 65–68, 88. Clausewitz’s explanation of friction is undoubtedly amongst his greatest contribution to the theory of war since, in his words, “friction is the only concept that more or less corresponds to the factors that distinguish real war from war on paper.” His equally famous dictum that “everything in war is very simple, but the simplest thing is difficult” elucidates the straightforward, but profound, truth that governs and limits every action in combat. As he further explains, “We should bear in mind that none of its [the unit’s] components is of one piece: each part is composed of individuals, every one of whom retains his potential friction.” The entire chapter seven is required reading and gives context to the friction, difficulties, and state of collapse that units struggle with at the NTC; Clausewitz, “Third Property: Uncertainty of All Information,” in Howard and Paret, On War, 88–89. Although Clausewitz does not specifically use the term “fog of war,” his description of the components of friction: physical exertion, intelligence (or lack thereof), and danger combined with the complex nature of moving, maneuvering, and leading a military organization filled with individuals suggest that all actions in war take place under a fog or haze of uncertainty. For a contrary interpretation of Clausewitz’s notion of “fog and friction,” see Eugenia C. Kiesling, “On War: Without the Fog,” Military Review 81, no. 5 (September–October 2001): 85–87.

7. Brig. Gen. Christopher R. Norrie, then commander, Operations Group, author’s personal notes from Senior Trainer In-Brief, July 2018.

8. For resources for using and developing tactical decision games (TDGs), see John F. Schmidt, Mastering Tactics: A Tactical Decision Game Workbook (Quantico, VA: Marine Corps Association, 1994); see also “Tactical Decision Games: Your Index for TDGs,” The Company Leader, accessed 12 September 2019, http://companyleader.themilitaryleader.com/tdg. TDGs are an easy and cost-effective way for battalion and brigade combat team commanders to not only train subordinate leaders but also to see how they think about tactical problems. Giving an officer or a noncommissioned officer a TDG to solve during staff duty or professional development sessions is a relatively simple way to build tactical competence, provide repetitions, and convey intent through feedback.
